(57) Abstract: A creation assisting method and apparatus, and a recorded medium, assisting a creator in readily creating a large amount of creations in a short time with a saved labor. Creation piece data each item of which is a pair of a creation piece and a piece index is stored in a database (4). The piece indexes are extracted from the database (4) and put in a reactor (9), making a set of piece indexes in correlation. Creation pieces corresponding to the piece indexes constituting the set are connected and outputted to automatically produce a creation. In each piece index, 5W1H information about the content of the corresponding creation piece and sensibility information about the sense given by the creation piece are described. The correlation is determined based on the described information, and a creation is produced which cannot be produced only by randomly connecting creation pieces.
